1 What does this function compute? Show the value it returns for `fib(5)`. [2 marks]

python

```
def fib(n):  
    if n < 2:  
        return n  
    return fib(n - 1) + fib(n - 2)  
  
print(fib(5))
```

2 What is the purpose of the `.uniq` call in this method? [2 marks]

ruby

```
def names(items)  
  items.map(&:name).uniq  
end
```

- ☐ A Sorts the names alphabetically
- ☐ B Removes duplicate names
- ☐ C Raises NoMethodError if any item is nil
